

# Bank Holidays API Documentation

The Bank Holidays API allows applications to retrieve official bank holidays for different countries, states, and years. It supports filtering by country, region, and year and returns holiday details including name, date, and type.

## Base URL

`https://api.example.com/v1/bank-holidays`

## Authentication

All requests require an API key passed in the request header.

### Header Example:

`Authorization: Bearer YOUR_API_KEY`

## Endpoint: Get Bank Holidays

`GET /bank-holidays`

Returns a list of bank holidays for the specified filters.

### Query Parameters

| Parameter | Type    | Required | Description                                   |
|-----------|---------|----------|-----------------------------------------------|
| country   | string  | Yes      | Country code (e.g., IN, US, UK)               |
| year      | integer | No       | Year to fetch holidays for (default: current) |
| region    | string  | No       | State or region code (e.g., KA for Karnataka) |

### Example Request

`GET https://api.example.com/v1/bank-holidays?country=IN&year;=2026&region;=KA`

### Example Response

```
{
  "country": "IN",
  "year": 2026,
  "region": "KA",
  "holidays": [
    {
      "date": "2026-01-26",
      "name": "Republic Day",
      "type": "National Holiday"
    }
  ]
}
```

```
},
{
  "date": "2026-08-15",
  "name": "Independence Day",
  "type": "National Holiday"
}
]
```

## Error Responses

| Status Code | Error        | Description                         |
|-------------|--------------|-------------------------------------|
| 400         | Bad Request  | Missing or invalid parameters       |
| 401         | Unauthorized | Invalid or missing API key          |
| 404         | Not Found    | No holidays found for given filters |
| 500         | Server Error | Unexpected server error             |

# Real-Time Payments (RTP) API Documentation

The Real-Time Payments (RTP) API enables instant money transfers between bank accounts. It allows applications to initiate payments, check transaction status, and retrieve payment history with low latency and high reliability.

## Base URL

`https://api.examplebank.com/v1/rtp`

## Authentication

All API requests require OAuth 2.0 Bearer Token authentication.

### Header Example:

`Authorization: Bearer ACCESS_TOKEN`

## Endpoint: Initiate Payment

`POST /payments`

Creates a new real-time payment transaction.

### Request Body

| Field            | Type    | Required | Description                    |
|------------------|---------|----------|--------------------------------|
| amount           | decimal | Yes      | Amount to transfer             |
| currency         | string  | Yes      | Currency code (e.g., INR, USD) |
| sender_account   | string  | Yes      | Sender bank account number     |
| receiver_account | string  | Yes      | Receiver bank account number   |
| reference        | string  | No       | Payment reference note         |

### Example Request

```
POST /v1/rtp/payments
{
  "amount": 5000,
  "currency": "INR",
  "sender_account": "1234567890",
  "receiver_account": "9876543210",
  "reference": "Invoice Payment"
}
```

### Example Response

```
{
  "transaction_id": "rtp_839201",
  "status": "processing",
  "amount": 5000,
  "currency": "INR",
  "created_at": "2026-03-08T10:15:00Z"
}
```

## Endpoint: Get Payment Status

GET /payments/{transaction\_id}

Returns the current status of a payment transaction.

### Example Response

```
{
  "transaction_id": "rtp_839201",
  "status": "completed",
  "completed_at": "2026-03-08T10:15:03Z"
}
```

## Error Codes

| Status Code | Error                 | Description                             |
|-------------|-----------------------|-----------------------------------------|
| 400         | Invalid Request       | Missing or invalid parameters           |
| 401         | Unauthorized          | Invalid authentication token            |
| 402         | Insufficient Funds    | Sender account has insufficient balance |
| 404         | Transaction Not Found | Transaction ID does not exist           |
| 500         | Server Error          | Unexpected server error                 |

# Voyager API Documentation

The Voyager API provides travel and booking services including flight search, hotel availability, booking management, and itinerary retrieval. This API is designed for travel platforms and booking engines that need real-time travel data.

## Base URL

`https://api.voyager.com/v1`

## Authentication

All requests must include an API key in the Authorization header.

`Authorization: Bearer YOUR_API_KEY`

## Endpoint: Search Flights

`GET /flights/search`

### Query Parameters

| Parameter   | Type    | Required | Description                        |
|-------------|---------|----------|------------------------------------|
| origin      | string  | Yes      | Departure airport code (e.g., BLR) |
| destination | string  | Yes      | Arrival airport code (e.g., DEL)   |
| date        | string  | Yes      | Travel date (YYYY-MM-DD)           |
| passengers  | integer | No       | Number of passengers               |

### Example Request

`GET /v1/flights/search?origin=BLR&destination=DEL&date=2026-04-01`

### Example Response

```
{
  "flights": [
    {
      "flight_number": "AI202",
      "airline": "Air India",
      "departure": "BLR",
      "arrival": "DEL",
      "price": 6500,
      "currency": "INR"
    }
  ]
}
```

# Endpoint: Create Booking

POST /bookings

## Request Body

| Field          | Type   | Required | Description                |
|----------------|--------|----------|----------------------------|
| flight_id      | string | Yes      | Selected flight identifier |
| passenger_name | string | Yes      | Passenger full name        |
| email          | string | Yes      | Passenger email            |
| payment_method | string | Yes      | Payment method used        |

## Error Codes

| Status Code | Error        | Description                |
|-------------|--------------|----------------------------|
| 400         | Bad Request  | Invalid parameters         |
| 401         | Unauthorized | Missing or invalid API key |
| 404         | Not Found    | Resource not found         |
| 500         | Server Error | Unexpected server error    |

# Corporate Cards API Documentation

The Corporate Cards API enables organizations to manage employee corporate cards, track transactions, set spending limits, and retrieve expense data in real time. It is designed for finance platforms, expense management systems, and enterprise tools.

## Base URL

`https://api.examplebank.com/v1/corporate-cards`

## Authentication

All API requests require OAuth 2.0 Bearer Token authentication.

Authorization: Bearer ACCESS\_TOKEN

## Endpoint: Create Corporate Card

POST /cards

### Request Body

| Field          | Type    | Required | Description                     |
|----------------|---------|----------|---------------------------------|
| employee_id    | string  | Yes      | Unique employee identifier      |
| card_type      | string  | Yes      | Type of card (virtual/physical) |
| spending_limit | decimal | Yes      | Monthly spending limit          |
| currency       | string  | Yes      | Currency code (e.g., INR, USD)  |

### Example Request

POST /v1/corporate-cards/cards

```
{
  "employee_id": "EMP1023",
  "card_type": "virtual",
  "spending_limit": 100000,
  "currency": "INR"
}
```

### Example Response

```
{
  "card_id": "card_874322",
  "employee_id": "EMP1023",
  "status": "active",
  "spending_limit": 100000,
  "currency": "INR"
}
```

```
}
```

## Endpoint: Get Card Transactions

```
GET /cards/{card_id}/transactions
```

Returns a list of transactions for a specific corporate card.

### *Example Response*

```
{
  "transactions": [
    {
      "transaction_id": "txn_90231",
      "merchant": "Amazon",
      "amount": 3500,
      "currency": "INR",
      "date": "2026-03-08"
    }
  ]
}
```

## Error Codes

| Status Code | Error          | Description                    |
|-------------|----------------|--------------------------------|
| 400         | Bad Request    | Invalid request parameters     |
| 401         | Unauthorized   | Invalid authentication token   |
| 403         | Forbidden      | Access denied to card resource |
| 404         | Card Not Found | Specified card does not exist  |
| 500         | Server Error   | Unexpected server error        |

# Account Transfer API Documentation

The Account Transfer API enables secure transfers of funds between bank accounts. It allows applications to initiate transfers, verify accounts, and track transfer status in real time. This API is typically used by banking apps, fintech platforms, and payment processors.

## Base URL

`https://api.examplebank.com/v1/account-transfer`

## Authentication

All requests require OAuth 2.0 Bearer token authentication.

Authorization: Bearer ACCESS\_TOKEN

## Endpoint: Initiate Transfer

POST /transfers

### Request Body

| Field        | Type    | Required | Description                    |
|--------------|---------|----------|--------------------------------|
| from_account | string  | Yes      | Source account number          |
| to_account   | string  | Yes      | Destination account number     |
| amount       | decimal | Yes      | Amount to transfer             |
| currency     | string  | Yes      | Currency code (e.g., INR, USD) |
| reference    | string  | No       | Payment reference note         |

### Example Request

POST /v1/account-transfer/transfers

```
{
  "from_account": "1234567890",
  "to_account": "9876543210",
  "amount": 2500,
  "currency": "INR",
  "reference": "Internal Transfer"
}
```

### Example Response

```
{
  "transfer_id": "trf_902311",
  "status": "processing",
}
```

```
"amount": 2500,  
"currency": "INR",  
"created_at": "2026-03-08T11:00:00Z"  
}
```

## Endpoint: Get Transfer Status

GET /transfers/{transfer\_id}

### Example Response

```
{  
  "transfer_id": "trf_902311",  
  "status": "completed",  
  "completed_at": "2026-03-08T11:00:05Z"  
}
```

## Error Codes

| Status Code | Error              | Description                   |
|-------------|--------------------|-------------------------------|
| 400         | Invalid Request    | Missing or invalid parameters |
| 401         | Unauthorized       | Invalid authentication token  |
| 403         | Forbidden          | Transfer not allowed          |
| 404         | Transfer Not Found | Transfer ID does not exist    |
| 500         | Server Error       | Unexpected server error       |
